6 Steps to Process DTMF Audios for Phone Surveys

1 Design the SurveyCTO form

Design the SurveyCTO form so that the sections where audio responses are recorded are short, this helps cleaner DTMF tone detection.

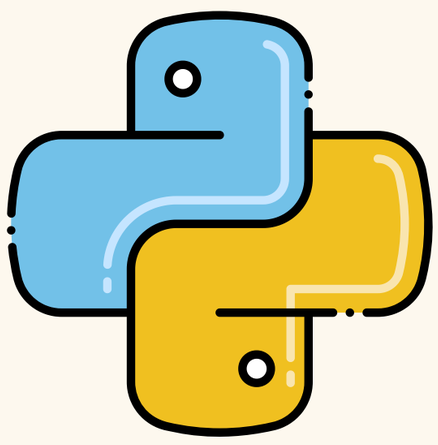

2 Extract the audio files

If recordings come directly from phones, they're usually .wav. Otherwise, convert them online to .wav format (to avoid compression and quality loss).

3 Organize your files

Place all .wav audios in the same folder where your 01_DTMF.py script is located.

4 Check dependencies

Make sure Python and required libraries (e.g., numpy, scipy, soundfile) are installed before running the script.

5 Run the detection

In the terminal from ypur computer or the terminal from Visual Studio Code, use:

python 01_DTMF.py -v audio_test.wav

Replace audio_test.wav with each of your recordings.

6 Log and interpret the output

Note the detected key sequences (e.g., 1 2 7 9 # *) and analyze patterns or inconsistencies for your gender survey dataset.
